

# PIDX: Scalable I/O for Massive Simulations

Sidharth Kumar, Steve Petruzza, Duong Hoang, Valerio Pascucci

“ With PIDX I/O time came down from 50% of total simulation time to 7%, thus allowing us to dump more data more frequently and have a much better understanding of the actual science.”  
 – Ben Isaac PhD (PIDX user and Research Associate at Institute for Clean & Secure Energy)

## PIDX salient features

- Has shown scalability to 768K cores.
- Generates analysis and visualization appropriate data format.
- Allows real-time monitoring of simulation.
- Allows ROI based dumps enabling simulations to dump regions to store data at varying resolution.
- Uses a compression scheme that allows reading and decompressing data at different bit rates.
- Has been tested on some of the fastest supercomputers of the world.
- Exposes lots of parameter and is very tunable.
